# runDM v1.0 - Manual

### April 27, 2016

### 1 Overview

The runDM code is a tool for calculating the low energy couplings of Dark Matter (DM) to the Standard Model (SM) in Simplified Models with vector mediators. By specifying the mass of the mediator and the couplings of the mediator to SM fields at high energy, the code outputs the couplings at a different energy scale, fully taking into account the mixing of all dimension-6 operators.

At present, the code is written in two languages: *Mathematica* and *Python*. For installation instructions and example code in each language, skip straight to Sec. 3. If you are interested in an implementation in another language, please get in touch and we'll do what we can to add it. Please contact Bradley Kavanagh (bradkav@gmail.com) for any questions, problems, bugs and suggestions.

If you make use of runDM in your work, please cite it as:

F. D'Eramo, B. J. Kavanagh & P. Panci (2016). runDM (Version X.X) [Computer software]. Available at https://github.com/bradkav/runDM/,

making sure to include the correct version number. Please also cite the associated papers:

## 2 General framework

This section describes the general framework of runDM, describing the general usage, inputs and outputs of runDM, as well as pseudocode for how to use the most important functions. For implementation-specific information, please see Sec. 3.

Functions in runDM accept as input a vector of couplings **c**. This vector has 16 elements, the coefficients of the dimension-6 DM-SM operators of the form:

$$\mathcal{O}_{\mathrm{DM},\mu}\,\mathcal{O}_{\mathrm{SM}}^{\mu}$$
 (1)

$$\mathbf{c} = \begin{pmatrix} c_q^{(1)} & c_u^{(1)} & c_d^{(1)} & c_l^{(1)} & c_e^{(1)} & c_e^{(2)} & c_u^{(2)} & c_d^{(2)} & c_l^{(2)} & c_e^{(2)} & c_e^{(2)} & c_d^{(3)} & c_u^{(3)} & c_d^{(3)} & c_l^{(3)} & c_e^{(3)} & c_e^{(3$$

where

$$\mathcal{O}_{q^{(i)}}^{\mu} = \overline{q}_{L}^{(i)} \gamma^{\mu} q_{L}^{(i)}, \qquad \mathcal{O}_{l^{(i)}}^{\mu} = \overline{l}_{L}^{(i)} \gamma^{\mu} l_{L}^{(i)}, 
\mathcal{O}_{u^{(i)}}^{\mu} = \overline{u}_{R}^{(i)} \gamma^{\mu} u_{R}^{(i)}, \qquad \mathcal{O}_{e^{(i)}}^{\mu} = \overline{e}_{R}^{(i)} \gamma^{\mu} e_{R}^{(i)}, 
\mathcal{O}_{d^{(i)}}^{\mu} = \overline{d}_{R}^{(i)} \gamma^{\mu} d_{R}^{(i)}, \qquad \mathcal{O}_{H}^{\mu} = i H^{\dagger} \overrightarrow{D}_{\mu} H.$$
(3)

$$C = \begin{pmatrix} c_{Vu}^{(1)} & c_{Vd}^{(1)} & c_{Vu}^{(2)} & c_{Vd}^{(2)} & c_{Vd}^{(3)} & c_{Ve}^{(1)} & c_{Ve}^{(2)} & c_{Ve}^{(3)} & c_{Au}^{(1)} & c_{Au}^{(1)} & c_{Au}^{(2)} & c_{Ad}^{(2)} & c_{Ad}^{(3)} & c_{Ad}^{(3)} & c_{Ae}^{(3)} & c_{Ae}^{(3)} \end{pmatrix}. \tag{4}$$

$$\mathcal{O}_{Vu^{(i)}}^{\mu} = \overline{u}^{(i)} \gamma^{\mu} u^{(i)} , \qquad \mathcal{O}_{Au^{(i)}}^{\mu} = \overline{u}^{(i)} \gamma^{\mu} \gamma^{5} u^{(i)} , 
\mathcal{O}_{Vd^{(i)}}^{\mu} = \overline{d}^{(i)} \gamma^{\mu} d^{(i)} , \qquad \mathcal{O}_{Ad^{(i)}}^{\mu} = \overline{d}^{(i)} \gamma^{\mu} \gamma^{5} d^{(i)} , 
\mathcal{O}_{Ve^{(i)}}^{\mu} = \overline{e}^{(i)} \gamma^{\mu} e^{(i)} , \qquad \mathcal{O}_{Ae^{(i)}}^{\mu} = \overline{e}^{(i)} \gamma^{\mu} \gamma^{5} e^{(i)} .$$
(5)

### 2.1 Initialisation

The input coupling vector **c** must be in the form of an array with 16 elements. To help with initialisation, **runDM** includes the function **initCouplings()**, which returns such an array, filled with zeroes. The user is then free to specify each of the 16 couplings in Eq. 2.

Alternatively, setBenchmark(benchmarkID) returns a coupling vector c corresponding to one of a number of preset benchmarks, specified using the string benchmarkID. The available benchmarks are:

- "Higgs" coupling only to the Higgs current operator:  $c_H = 1$ , all other couplings zero.
- "Universal Vector" universal vector coupling to all fermions:  $c_q^{(i)} = c_u^{(i)} = c_d^{(i)} = c_l^{(i)} = c_e^{(i)} = 1, c_H = 0.$
- $\bullet$  "UniversalAxial" universal axial-vector coupling to all fermions:

$$-c_q^{(i)} = c_u^{(i)} = c_d^{(i)} = -c_l^{(i)} = c_e^{(i)} = 1, c_H = 0.$$

• "QuarksVector" - vector coupling to all quarks:

$$c_q^{(i)} = c_u^{(i)} = c_d^{(i)} = 1, c_l^{(i)} = c_e^{(i)} = c_H = 0.$$

• "QuarksAxial" - axial-vector coupling to all quarks:

$$-c_q^{(i)} = c_u^{(i)} = c_d^{(i)} = 1, c_l^{(i)} = c_e^{(i)} = c_H = 0.$$

• "LeptonsVector" - vector coupling to all leptons:

$$c_l^{(i)} = c_e^{(i)} = 1, c_q^{(i)} = c_u^{(i)} = c_d^{(i)} = c_H = 0.$$

• "LeptonsAxial" - axial-vector coupling to all leptons:

$$-c_l^{(i)} = c_e^{(i)} = 1, c_q^{(i)} = c_u^{(i)} = c_d^{(i)} = c_H = 0.$$

• "ThirdVector" - vector coupling to third generation fermions:

$$c_q^{(3)} = c_u^{(3)} = c_d^{(3)} = c_l^{(3)} = c_e^{(3)} = 1$$
, all remaining couplings zero.

• "ThirdAxial" - axial-vector coupling to third generation fermions:

$$-c_q^{(3)} = c_u^{(3)} = c_d^{(3)} = -c_l^{(3)} = c_e^{(3)} = 1$$
, all remaining couplings zero.

If the value of benchmarkID is not recognised, setBenchmark simply returns a coupling vector filled with zeroes.

### 2.2 runCouplings

The function runCouplings( $\mathbf{c}$ ,  $E_1$ ,  $E_2$ ) accepts as input a vector of couplings  $\mathbf{c}$ , defined at energy  $E_1$  (in GeV) and returns a vector of couplings evaluated at energy  $E_2$  (in GeV), taking into account the running, matching and mixing between the two energies. If  $E_2 > m_Z$ , runCouplings returns the elements of  $\mathbf{c}$ , the vector of couplings above the EWSB scale defined in Eq. 2. Alternatively, if  $E_2 < m_Z$ , runCouplings returns the elements of  $\mathcal{C}$ , the vector of couplings in the EFT below the EWSB scale, defined in Eq. 4.

# 2.3 DDCouplings

The function  $DDCouplings(\mathbf{c}, E_1)$  accepts as input a vector of couplings  $\mathbf{c}$ , defined at energy  $E_1$  (in GeV). The running is performed down to the nuclear energy scale of 1 GeV and the function returns a vector of the low-energy couplings to light quarks (u, d, s) relevant for direct detection:

$$C_q = \left(c_V^{(u)}, c_V^{(d)}, c_A^{(u)}, c_A^{(d)}, c_A^{(s)}\right). \tag{6}$$

# 3 Implementations

### 3.1 Mathematica

In order to use the *mathematica* implementation of runDM, simply copy the *mathematica* package file runDM.m into the same directory as your notebook and then use Get:

```
Get[NotebookDirectory[] <> "runDM.m"];
```

Below is an example code snippet for calculating (and plotting) the low energy couplings to light quarks (relevant in direct detection experiments) at the nuclear energy scale, assuming a mediator of mass  $m_V$  which couples through the axial-vector current to all SM quarks:

### 3.2 Python

```
import runDM

#Z mass

mZ = 91.1875

#Nuclear energy scale

ELN = 1

c = sr.InitCouplings()

c[0] = 1.0

#c[-1] = 1.0

mV = np.logspace(0, 5, 100)
```
